Word order in Topic-Focus structures in the Balkan languages

Iliyana Krapova

Introduction

Balkan languages can be said to belong to the so-called discourse-prominent languages, i.e. languages whose surface structure encodes through special syntactic means, rather than just prosodically, discourse(-semantic) functions such as Topic (discourse given or old information) and Focus (discourse new or emphatically represented information). In this contribution, we will show that at least in the three Balkan languages under study (Romanian, Bulgarian and Modern Greek, henceforth Greek), the two main types of discourse structures - topicalization and focalization – share a whole array of common syntactic properties and that their word order, at least in the preverbal field, is to a large extent shaped by information structure requirements.

We will use the terms “Topic” and “Focus”, and we will speak of topicalization and focalization, respectively, since, apart from providing a convenient methodology for empirical generalizations, this precise theoretical way of capturing the role of information structure in syntax, has proved fruitful for syntactic description and is typologically well motivated. The terms themselves do not coincide with the traditional distinctions Theme and Rheme, although their essence captures the traditional Prague school intuition that each sentence can be divided into a discourse-familiar or discourse-given part (theme, osnova, základ) and a discourse-new part (rheme, jádro ‘nucleus’, cf. e.g. Cyxun 1962, Ivančev 1978).

Given the correlations between types of phrases in the preverbal field, as well as their relative order, the purpose of this contribution is to show that the so-called ‘Left Periphery’ (cf. Rizzi 1997) of the Balkan sentence is organized in a very similar way. Minimal variation between discourse structures is related to independent language internal differences, such as Case distinctions, the position of the clitic pronouns, use of special prepositions for object reduplication (such as pe in Romanian), etc.

While the existence of Left Peripheral structures is by no means an original Balkan phenomenon (the phenomenon is present in diverse language groups from Romance to Semitic), the purpose of studying the Balkan Left Periphery is twofold: on the one hand, it can offer support for the presence of a universal Left Periphery, which has already been postulated typologically on the basis of a wide range of cross-linguistic studies; on the other hand, given that Topic and Focus structures are intimately related to purposes of communication and are most typical for colloquial speech, it comes as no surprise that the same mechanism underlying mutual comprehension could be held responsible for the quasi-identical ordering of phrases in sentence initial positions. One could also hypothesize that during the period when Balkanisms started to emerge, structures where discourse functions are overtly marked must have been favoured by speakers involved in any type of (bi- and multi-)lingual contacts (cf. Lindstedt 2000). While historical considerations will not play a role in the present contribution, this is nevertheless a direction worth being explored in the future.

Topic- and Focus-related notions can also be marked in sentence final positions. Both the sentence initial, and the sentence final positions (called ‘strong positions’ by Cyxun 1962, 268) are strongly endowed with discourse features, given discourse continuity. The sentence final position is typically associated with one type of Focus (New Information Focus, cf. Kiss 1998), or the rheme in the strictest (classical) sense of the term. Following it, one can find also Topic elements (direct and indirect objects) which are typically marked by syntactic
means such as clitic doubling (‘anticipatio’, in Lopašov’s 1978 terminology)\(^1\) or Clitic Right Dislocation (extraposition to the right). Cf. some examples from Bulgarian: Ostavi ja onaja Marian – poznavam ja dobre; Toj izpälni tova, koeto mi obešta na men – da se bie mâžki; Daj ja naj-setne taja legendarma posledna cigara; Az ne mu ja kazax istinata. Such cases are in need of a better understanding not only in Bulgarian but in all of the Balkan languages given the pervasive use of such constructions (for a recent discussion on Greek and references, see Philappaki-Warburton et al. 2004).

In this paper we will only concentrate on the Left Periphery, which following illuminating work by Rizzi (1997), has been applied to many languages in the last years and may therefore serve as a typologically well-motivated basis for any work on Balkan comparative syntax.

1. The Position of Topic and Focus in the Balkan Languages

The sentence-initial position of Topic and Focus is typical for all the Balkan languages under study.

(1) a. Ivan ne sâm go viždala otđavna; b. Samo Ivan šte pokanja; Ivan, nego iskam da pokaniš.\(^2\)

(2) a. Tin Eleni dhen tin idha; b. To Jani idhe i Maria; Afton thelo na kalesis.

(3) a. Pe Ion, l-am vâzut; b. Mašinâ vrea Victor, nu casă.

Examples (1a, 2a, 3a) present topicalized direct objects; the examples in (1b), (2b), (3b) represent focalized direct objects.

Reduplication by a pronominal clitic (also referred to as ‘reprisa’, cf. e.g. Lopašov 1978) is the classical mark or Object Topicalization in all of the Balkan languages (Assenova 2002).\(^3\)

From the point of view of current formal syntactic theorizing, Topic structures are seen as involving dislocation of an (direct or indirect) object to the preverbal position. From the point of information structure, the word order corresponding to (1a), (2a), (3a), is referred to as objective word order (‘prav slovored’, cf. Ivančev 1978), since sentence initial Topics are linked to the preceding discourse and thus serve as a starting point (‘terme de départ’, in Guéntcheva’s 1994 terminology) for the actual predication. The Topic can also be viewed as the logical (notional) subject of the predication, i.e. what the predication is about. The rest of the sentence belongs to what is generally called ‘Comment’, i.e. the predication itself (cf. Vallduvì 1992). Since the clitic is obligatory, this type of dislocation has also been termed Clitic Left Dislocation (CLLD) (introduced by Cinque 1990 for similar constructions in Romance). This is the term we will be using here.

---

1 We follow Lopašov (1978, 14) in differentiating two types of structures: those in which the object is preposed with respect to the verb (reprisa), and those in which the object is postposed (‘anticipatio’). Although he considers the difference in quantitative terms, there are other, deeper differences between these two structures. There are also historical considerations for such a distinction, at least in Bulgarian. As reported by Minčeva (1969), Topicalization qua preposing of the object is a much older phenomenon, as it can be found in a number of contexts in Old Church Slavonic. Typically, the anaphoric pronoun or a demonstrative pronoun used to double the preposed (heavy and intonationally independent) object. Anticipatio, on the other hand, is a later phenomenon – the earliest documents in which it is attested date from the 12\(^{th}\)-13\(^{th}\) c. According to Minčeva, the later expansion of anticipatio, while still attributable to the syntactic principles of colloquial speech, involves additional factors such as the position of the enclitic, the syntactic independence of the verbal group, etc.

2 In all the examples to follow, focused phrases will be given in bold.

3 Historically, the primary function of object reduplication (‘reprisa’) has been related to the grammaticalization of the SVO word order in the Balkan languages, following the loss of Case distinctions, whose most visible effects are observed in Bulgarian. Apart from ensuring a greater word order freedom and achieving discourse prominence, the topicalization of the object in a sentence initial position serves other syntactic purposes, such as the disambiguation of (potentially ambiguous) subject – object structures (cf. Lopašov 1978, 83, 99, 101-105, Assenova 2002, 108f), e.g. Dimov go ubi Meri Lamour (from Popov 1962).
Focalized phrases, on the other hand, enter into another type of information structure articulation: the Focus - Presupposition articulation, well-known since Chomsky (1972). Sentence initial Focus (also referred to as Contrastive Focus or Identificational Focus, cf. Kiss 1998) is a specific type of Focus. Pragmatically, it expresses the speaker’s intention to resolve a potential misunderstanding or doubt on the part of his interlocutor, or to correct some (part of a previous) statement. Therefore, Contrastive Focus is necessarily associated with some contextually determined set of alternatives for which the predicate holds potentially, by pointing out the unique member (or subset) of that set for which the predicate actually holds (Zubizarreta 1998, 6). Syntactically, this strategy makes use of the subjective word order (‘obraten slovored’, cf. Ivančev 1978): the corrected information is presented in the first place since it is the most relevant part of the utterance and is typically pronounced with (strong) emphasis (‘logičesko udarenie’Popov 1961, Cyxun 1962, 287). Contrastive Focus conveys new information but only indirectly: by excluding potential alternatives, this type of logical emphasis may also reveal some new property or some potentially novel quality of the entity talked about (Popov 1961).

Given the examples in (1b)-(3b), Focus can also be said to involve dislocation, but without an accompanying clitic pronoun. The dislocation of a Topic or a Focus to a preverbal position can be schematically represented as in (4), a & b respectively.

\[
\begin{align*}
(4) \text{ a. } & \quad [\text{Topic } \text{XP} ]_i, \text{ cl} \text{ V} \quad t_i \\
\text{ b. } & \quad [\text{Focus } \text{XP} ]_i \quad V \quad t_i
\end{align*}
\]

The abstract representations in (4) indicate that topicalization and focalization involve the same type of structure, differing only in the presence or absence of a clitic. In both cases the object starts out from an object position, as a verbal argument, and dislocates to the preverbal position, leaving a trace (t) in its original position. Only in (4a), the clitic mediates the syntactic relation between the preposed object and its trace, ensuring co-referentiality (Guéntcheva 1994, 119).

In the absence of doubling, i.e. when another type of phrase (prepositional phrase, adverbial phrase, etc.) preposes to a Topic or a Focus position, the difference between the two discourse structures is achieved only prosodically (low stress, flat intonation, intonational pause vs. emphatic stress). Naturally, in the absence of such clues, it is the context that resolves potential discourse ambiguities (cf. Joseph & Philippaki-Warburton 1987, 99-102 for Greek, Rudin 1991 for Bg).

Examples from Greek and Bulgarian featuring dislocated prepositional phrases are given bello:

(5) a. (Gr) Sto xorio tis pijeni poli sixna. Me sevazmo prepei na milate sto patera sas. Stu Jani na pame appose.  

---

4 This type of Focus should be strictly differentiated from New Information Focus, which, as mentioned above, corresponds best to the traditional notion of theme and appears in sentence final position, since it can be used as an answer to a question requesting new information, e.g. Kakvo donese Ivan? - Ivan donese [IF knigite].

6 In Greek, dislocation for emphasis can be accompanied by an emphatic nonclitic proform, cf. Stin Elada, eki na pame jia djakopes; Tin kiriaki, tote na pame (Joseph & Philippaki-Warburton 1987, 100)
Two types of topicalization structures

Having seen the basic structure types underlying topicalization and focalization, we proceed by noting that in the Balkan languages under study, there are two types of Topic structures. Thus, alongside (1a)-(3a), there exist cases like (6).

(6) a. (Cît despre) Ion, l-am văzut pe el, de anul trecut. (Rom)
b. (Kolkoto do) Ivan, včera go, srešnax nego. (Bg)
c. (Oson afora) tin Maria, dhen tin; anteho afti, allo. (MG)

The constructions in (6) have been studied for each of the three Balkan languages (Dobrovie-Sorin 1990, 1994, Anagnostopoulou 1994, 1997, Rudin 1986, Đzoneva 2004, etc.). Our task here is to outline in a comparative way their cross-Balkan properties. The existence of the construction in (6) has been noted first for Romance (cf. Cinque 1977, 1990) and has been labeled Hanging Topic Left Dislocation (HTLD) – a term which was meant to distinguish it from CLLD. We will see below that the distinction between the two types of left dislocation is also valid for all the Balkan languages under study. In particular, Balkan HTLD shares all the properties characteristic of Romance HTLD, with one notable difference: while in Romance the resumptive element can be a tonic pronoun without any accompanying clitic, in the Balkan languages, the tonic pronoun must be doubled by a clitic, as the ungrammaticality of (7) compared with (6b) shows:

(7) *(Kolkoto do) Ivan, srešnax nego, včera.

In discussing cases like (6) in Bulgarian, Guentchëva (1994) argues that the extraposed term (the HT in our terminology) is co-referential only with (and reduplicated only by) the tonic pronoun. The real reduplication, however, takes place between the tonic pronoun and the clitic, since only this configuration is sentence-internal. Therefore, the author excludes the possibility of analyzing cases such as A sârreto# bjas go kâsa nego kleto (p. 157) which are parallel to (6b) above, as involving “triple reduplication”.

1.2. Properties of Hanging Topics

Hanging Topics have clear pragmatic, prosodic and structural properties. First of all, from a pragmatic point of view, the relation of this type of Topic and the following Comment is rather loose, i.e. the HT creates only a general context for the Comment, which is why in the literature such constructions are also referred to in Guéntcheva (1994) and Assenova (2002) as extraposition Topics, segmented phrases (in the sense of Ch. Bally 1932/1965) or thématisation forte (‘strong Themes’). Additionally, from a prosodic point of view, there is a sharp intonational break between the left dislocated phrase and the rest of the sentence, especially if it is introduced by as for expressions (‘thématisateurs’ in Feuillet’s 1990 terminology), such as što se otnasja do/kolkoto to, cît despre, oson ja/oson fora, whose purpose of to clause off the HT from its Comment.

Following the standard practice, in the examples below the (heavy) intonational pause after the HT will be indicated with the symbol #.
Despite these peculiarities of HTLD, which are not shared by CLLD, where the dislocated XP acts as a real double of the resumptive clitic and is necessarily interpreted in its base (argument) position, the two constructions are not distinguishable when the dislocated Topic is a simple noun phrase and therefore not easy to differentiate. This is especially true in cases where neither such Topic-introducers are present, nor is it obligatory (sometimes) to have a sharp intonational pause. Therefore, one needs to apply some other test from the range of diagnostics offered by Cinque’s 1977 study on comparable Topic constructions in Romance.

The first and perhaps the most important diagnostic has to do with Case-matching, or Case connectivity: only CLLD requires a complete matching not only of person/number/gender, but also of Case features between the dislocated phrase and the resumptive pronoun (which is necessarily a clitic). Since no such requirement is necessary for the HTLD construction, the dislocated phrase can appear (and usually does appear) in the Nominative case (also known as Nominativus pendens): the clitic, on the other hand, is in whichever Case the verb in the associated sentence requires. Since the Accusative vs. Nominative distinction is preserved in the nominal system of Greek, the possibility of a Nominative Topic (resumed by a clitic in some other Case) is a clear indication of the presence of HTLD. Thus, alongside (6b) where the Accusative Case is required by the ‘thematisateur’ oson afora, Anagnostopoulou (1997, 154) reports cases like (8) where the initial Topic is Nominative.

(8) I Maria# tin ematha kala tosa xronia, ksero pos na tis miliso.

As shown by Anagnostopoulou (1994, 1997), and Alexiadou (1997), Nominative Topics in Greek can only appear in root clauses. In embedded clauses, on the other hand, the dislocated object must have its regular Accusative case. This in itself already points to the fact that whenever we have the configuration XP……cl in an embedded clause, we must be dealing with a CLLD structure, as in (9). Since the same type of restriction holds for Romance, it can be considered as a second general diagnostics for the presence of HTLD.

(9) Ipe oti *i Maria/ tin Maria tin emathe kala tosa xronia.

Other diagnostics prove crucial for Romanian and Bulgarian, given the absence of a Nominative vs. Accusative distinction in the nominal system of the former, and the absence of any Case distinctions in the nominal system of the latter. Carmen Dobrovie-Sorin (1990) suggests that in Romanian topilized phrases introduced by pe can only enter the CLLD construction because this preposition (similarly to the preposition a in Spanish) is only licensed internally to the associated sentence with respect to a (definite and [+human]) direct object phrase. This proposal receives support from the incompatibility between dislocated objects introduced by pe and emphatic pronouns, which are typical for the HTLD.

(10) *Pe Maria nu vrea s-o mai văd pe ea cît trăiesc. (Dobrovie-Sorin 1990, 373)

The example thus illustrates the following generalization: any distinguishing property, which is compatible with just one of the two constructions and is found in a context compatible only with the other construction, yields ungrammaticality. We expect therefore that if a dislocated phrase resumed by a tonic pronoun, which is only compatible with HTLD construction, is found in an embedded context, ungrammaticality will arise, since embedded contexts are compatible only with the CLLD construction, but not with the HTLD construction. That this generalization is correct is shown by the ungrammaticality of (11a) from Bulgarian, which should be compared with the parallel case in (11b) featuring the CLLD construction:
(11)a. *Kazax, če Marija# az sâm i kupil na neja cvetja.
b. Kazax, če na Marija az sâm i kupil cvetja.

Of course, the sequence following the complementizer če in (11a) is grammatical if used in a root clause, cf. (12a). Also grammatical is the variant where the dislocated indirect object retains its preposition na ‘to’, cf. (12b). Note however, that the grammaticality of (12b) has to meet two additional criteria: no resumptive tonic pronoun is allowed to appear inside the clause and no intonational pause can follow the dislocated indirect object, cf. (12c) and (12d) which are ungrammatical because one or the other requirement is not met:

(12) a. Marija# az sâm i kupil na neja cvetja.  
   b. Na Marija az sâm i kupil cvetja.  
   c. *Na Marija az sâm i kupil na neja cvetja.  
   d. *Na Marija# az sâm i kupil cvetja.

What the Bulgarian examples reveal is another peculiarity of the HTLD construction: the dislocated phrase can only be a noun phrase (NP), not a prepositional phrase, nor a phrase of some other category. No such restriction exists for CLLD. This distinguishing property, offered as another diagnostic by Cinque (1977), is employed only in contemporary Bulgarian where indirect objects are prepositional phrases (PPs). Given that Romanian has no prepositional indirect objects and that in Greek, prepositional indirect objects cannot be clitic resumed (cf. Sto Jani tha dhosi i Maria ta lefia avrio - Brian & Philippaki-Warburton 1987, 99), then it must be the case that Topicalized Case marked indirect objects in these two languages may participate only in the CLLD construction, observing Case connectivity.

Presence/lack of Case connectivity is applicable to Bulgarian only in the case of Topicalized pronouns. As made evident recently by a corpus collected by Marina Dţoneva (cf. Dţoneva 2004), Bulgarian colloquial speech makes an abundant use of Nominative pronouns as left dislocated Topics. Two examples are given in (13). The absence of Case connectivity between the Topical pronoun az ‘I’ and the resumptive clitics mi/me ‘(to) me’ identifies the use of the HT strategy.

(13) a. Az# na mene tova nikoga ne mi se e slučvalo.  
   b. Az# mene me e jad, če si vključiix Klip navremeto.

Both examples feature the tonic pronoun mene ‘me’ which, given its position after the intonational break, and Case connectivity, can only be analyzed as a CLLD object. Nominative Topics are also characteristic of (eastern) Bulgarian dialects and in fact, have been reported to exist from the earliest manuscripts reflecting in writing the specific properties of the colloquial language (13th c., cf. Minčeva 1969 for examples, references and

---

8 We do not mean that all criteria have to be met in order for a certain construction to qualify as a HT. For example, if a tonic pronoun is not realized in a certain structure, then Case connectivity becomes the distinguishing factor between a CLLD and a HT structure, cf. Na Ivan otdavna ne sa mu plaštali vs. Ivan otdavna ne sa mu plaštali (from Dţoneva’s corpus).
9 It could be the case that in Greek, dislocated indirect objects cannot function as HTs, cf. the ungrammaticality of (i) reported by Alexiadou (1997):
   (i) *I Maria, o Janis tis ta edhose ta vivlia.
10 The tonic pronoun can also occur at the absolute end of the sentence. In this case, then we are dealing with the mirror image of the CLLD – Clitic Right Dislocation. The latter is also typical for marking Topical objects (or as afterthoughts) in Bulgarian, as well as in the other Balkan languages.
discussion about the presumed archaic nature of such constructions). (14) below gives some dialectal examples, taken from Stoykov (1962/2002, 260) and Mladenov (1965, 213):

(14) a. As inna’ žinà beši mi kàzala (Belensko); b. Toj n’àma da gu ima tàm (Slivensko); c. Ja ide mi se; d. Ja snošti ič mi se ne slizaše. (Ixtiman).

According to Mladenov (1965), Nominative pronouns as Topics are found even in dialects which do not allow clitic resumption, such as the Ixtiman dialect. However, we should be more careful in qualifying all cases of the wide array of such constructions.

There is a further diagnostics in Bulgarian for differentiating CLLD Topics, namely the position of the clitic with respect to the dislocated object. As is well-known, differently from Romanian and Greek, Bulgarian clitics obey the Tobler-Mussafia law, i.e. they cannot occupy a first position after an intonational pause. Cf. the ungrammaticality of *Ivan# go vidjàx nego vèra. According to Minčeva (1969, 19), cases in which the clitic leans on the last word of a previous phrase, as well as the inverse cases in which the clitic encliticizes without being related to its host, point to the fact that the position of the clitic is syntactic, rather than prosodic. In the Bulgarian data at hand, we observe that whenever there is no pause to separate the dislocated object from the rest of the sentence, the clitic is enclitic on this object, e.g. Mene me čaka rabota. This is the case of the CLLD construction. However, when the clitic follows after a pause, as it happens in the HTLD construction, either the verb inverts, and the clitic encliticize on it, as in (14c), or else, the clitic is hosted by an additional (CLLD) Topic or a Focus phrase, in preservation of the order Cl V, as in (13b), (14d). Given that according to Cyxun (1962) even V inversion around the clitic is informationally triggered, we can conclude that clitic is hosted by whatever material receives some discourse shaping.

However, we have to note that this is not always the case, since sometimes, in the absence of a pause, the clitic may encliticize on a Nominative Topic pronoun. This is frequent with expeiercer constructions of the type Az mi se iska. Yet we also find cases of a verb > clitic order following after a Nominative Topic, e.g. Az# iskaše mi se da razbera nešto poveće za Tàrnovo (from Dżoneva’s corpus). Such differences merit further research; here it is worth noting that Nominative Topics, at least with experiencer verbs, are not always HTs.

1.3. Linear orders

The example in (14) above from colloquial Bulgarian gives evidence that in case a HT co-occurs with a CLLD Topic, the former must precede the latter. As expected, the reverse sequence gives rise to ungrammaticality, whatever the intonational contour, cf. *Na mene az tova nikoga ne mi se e slučvalo. This general general property of HTs (namely, that they occupy an absolute sentence initial position) is supplemented by a uniqueness requirement: there can be only one HT per sentence. CLLD Topics, on the other hand, are exempt from the uniqueness requirement. Consequently, more than one such Topic can appear per clause, and there is no particular order observed. The data collected by Alboiu (2000) for Romanian, by Anagnostopoulou (1994, 1997) for Greek, and by Arnaudova (2002) and Krapova (2002) for Bulgarian, confirm this generalization. There are interpretational differences which need to be studied separately. So, for example, according to Alboiu (2000, 270), in Romanian, the highest Topic has maximum relevance for the discourse context, but otherwise all combinations are possible. In the examples below, Topics are given in brackets, so that their free ordering can be made more evident.

(15) a. [ŢTa vivlia] [Ţ tis Marias] tis ta edhose to Janis; [ŢTis Marias] [Ţ ta vivlia] tis ta edhose o Janis.
1.4. Movement of the CLLD object

Recall that in section 1, we postulated that the Left Periphery of the sentence contains a Topic position which is targeted by clitic resumed material counting as a Topic. However, given the above discussion on the distinction between HTLD and CLLD, we should try to find out whether both types of Topicalization involve movement. Following the conclusions reached unanimously by all of the authors who have studied the distribution of HTs in the Balkan languages, we maintain that this particular type of dislocation is not derived by movement (cf. in particular Rudin 1986, Dobrovie-Sorin 1990, Anagnostopoulou 1997). Some arguments to this effect are presented below. As far as CLLD is concerned, Case Connectivity already indicates that movement has taken place: the matching clitic functions as an anaphoric element which connects the original (base) position of the dislocated argument to its surface position.

1.4.1. ‘Unboundedness’

A first piece of evidence that the CLLD construction is derived through movement comes from the fact that it not limited to monoclausal domains (Anagnostopoulou 1997): the dislocated phrase can appear outside of the embedded clause to which it belongs. Hence the term ‘unboundedness’. (15) provides examples from Greek and Bulgarian showing that the embedded Topics have been dislocated into the domain of the matrix clause.

(15) a. Tin Eleni, su ipa xthes oti t, tin idha t
b. Prestǎpnika, mislja, če t, sa go xvanali t

Such observations point to a movement operation - the Topic starts out from the complement clause and dislocates to a position in the Left Periphery of the embedded clause, after which it moves into the Left Periphery of the matrix clause. This is indicated by the identical indices on the traces left at the positions through which the Topic passes on its way to its surface position. We do have independent evidence that Topic has moved through a position to the right of the complementizer given the following variants of (16):

(16) a. Su ipa xthes oti [tin Eleni], tin idha ti.b. Prestǎpnika, mislja, če ti, sa go xvanali ti.

The examples above show that there is position to the left of the subjunctive complementizers (particles) dalna, as well as to the left of the wh-word in indirect questions, through which the Topic moves into before it continues to the matrix clause.

Hanging Topics are also unboundedly distant from their resumptive pronouns. However, differently from CLLD, they cannot appear in any intermediate position (given that they are
illegitimate in embedded clauses). Consequently, they are not moved from the embedded clause but are directly generated in the matrix clause.

1.4.2. The position of anaphors
The second piece of evidence comes from the syntactic behavior of reflexive pronouns and expressions containing a reflexive pronoun. As is well known, such expressions function as anaphors which have to be bound by their antecedents. In all of the Balkan languages under study reflexives are impossible as HTs but are perfectly grammatical as CLLD Topics. Compare the following pairs:

(18) a. *O eaftos tu, # o Janis, dhen ton frontizi ti (Gr - Anagnostopoulou 1997, 155)
    b. Ton eafto tu, o Janis ton, prostatevi ti.
    b. Pe sine, Victor, nu s-ar pun in pericol ti.
(20) a.*[Vsičkite si prijateli], # gledam da im pomogna ti (s kakvoto moga). (Bg)
    b. [Na vsičkite si prijateli], gledam da im pomogna ti (s kakvoto moga).

In all of the grammatical examples, the anaphor has to reconstruct to its base position (indicated by the trace) in order to be interpreted as bound by its antecedent which shares the same index. The ungrammatical examples, on the other hand, represent a reflexive contained within a HT. Since the anaphor is left unbound, we infer that no reconstruction has taken place. Therefore, such cases constitute evidence that the HT is generated directly in its surface position rather than moved there.

1.4.3. Island sensitivity
A third piece of evidence which distinguishes between presence vs. lack of movement has to do with islands. Islands are clauses (or phrases) that do not allow any phrase internal to them to move out. A typical example of islands is an adverbial clause (adjunct clause). The examples below are meant to show that HTs are not sensitive to any islands, because if they were, they would not be able to move out. CLLD, on the other hand, are sensitive to (strong) islands and therefore, movement out of the island is impossible (as indicated in (21b):

(21) a. (Kolkoto do) Ivan# Marija napravo izbjaga [[island kato go celuna].
    b.*Na Ivan Marija napravo izbjaga, [island kato mu prizna vsičko].

Similar data are reported for Romanian and Greek:

(22) a. (Cit despre) Ion # am plecat înainte să-l-examineze Popescu; Cit despre Ion, n-am întîlnit fata care l-a văzut ultima dată.
    b. *Pe Ion am plecat înainte să-l-examineze Popescu; *Pe Ion n-am întîlnit fata care l-a văzut anul trecut. (Dobrovie-Sorin 1994, 219)
(23) *Tin efemerida apokimithike diavazontas. (Anagnostopoulou 1997, 172)

We summarize with the Table below all the properties of the two types of left dislocation constructions, and we add one more illustrating example.

## 1.5. Topic structures in embedded clauses

From the facts discussed so far the following empirical generalizations emerge:

1) Hanging Topics precede CLLD Topics in all of the languages under study;

2) Embedded CLLD Topics follow the declarative complementizers/subordinators oti/če/că (cf. example (24) from Romanian). Additionally, in Greek and Bulgarian CLLD Topics can sometimes (and for some speakers) appear in front of this complementizer, cf. (25).

(25)a. Ipe (?to vivlio) oti (to vivlio) ton agapai poli (Gr - Anagnostopoulou 1997, 168). b. Misla (prestăpника) ĉe prestăpnika sa go xvanali. (Bg)

3) Embedded CLLD Topics typically precede the interrogative complementizers an/dali (for lack of space we do not illustrate these cases here).

4) Embedded CLLD Topics must precede the subjunctive complementizer/particle na/da which, as is well-known, require strict adjacency with the verb in all of the Balkan languages. In Romanian, the constituent preceding the subjunctive complementizer să,
although it can be clitic resumed and therefore may qualify as a CLLD Topic, has to meet the additional requirement of emphasis (Cornilescu 2000), cf.(26).

(26) As dori [pe Ion] să-l chemei miine.

5) CLLD Topics precede the wh-word/phrase in embedded wh-questions:

(27) a. Dhen ksero afto to vivlio, pjos tha to diavasi ja avrio.\(^{11}\)
    b. Čudja se tazi roklja koga (li) izobšto šte ja obleka.
    c. Mā intreb pe Petre cine-l mai crede.

2. Focus constructions

2.1. Similarities with CLLD Topic constructions

There a number of distributional similarities between CLLD Topics and focused phrases in the Balkan languages under study. As suggested in the literature, the position of Focus is also a result of movement (cf. in particular Tsimpeli 1995), these similarities can be attributed to the movement nature of Focus phrases, as suggested by the representation in (4b). (28) gives examples of Focus phrases accompanied by a focus particle like samo/mono. The focused object phrases can be definite or ‘bare’, i.e. unaccompanied by any definite or indefinite determiner:

(28) a. Samo cvetja šte kupja (ne bonboni); Samo cvetjata šte i podarja.
    b. Mono ta luludhia dialeksa moni mou; Mono luludhia aghorasa.

We have observed that focused phrases (in Greek and Bulgarian) can appear: a) displaced in a matrix clause even though they belong to an embedded clause; b) in front of a declarative or an interrogative complementizer; c) in front of a wh-word/phrase in a wh-question.\(^{12}\) All of these properties are attested in Greek and Bulgarian:

(29) a. [\(\text{Ti Maria}\)] lene oti pandreftike o Janis; [\(\text{ton Jani}\)] rotisan pjos efighe (Tsimpeli 1995, 193).
    b. Lene [\(\text{ti Maria}\)] oti pandreftike o Janis (Joseph & Philippaki 1987, 104); Mu ipe [\(\text{to Jani}\)] oti idhe; Me rotiše [\(\text{ta vivlia}\)] an aghorasa (Alexiadou 1997, 73).
    c. Anarotieme [\(\text{tu Petro}\)] ti to edoses; Me rotiše [\(\text{ta vivlia}\)] pjos aghorasa.

(30) a. [\(\text{ti Maria}\)] misija, če šte izberam za predsedatel.
    b. Ivan znaex, če šte xodi, no [\(\text{ti}\)] če šte xodih, ne znaex (from Rudin 1991)
    c. Čudim se [\(\text{na srekija}\)] kakvo da podarim.

Given that these properties are tests for a movement derivation, we can conclude that the dislocated position of Focus is also derived by movement: (29a)/(30a) show instances of unbounded (long-distance) Focus movement; (29b)/(30b) show instances of short Focus movement (to the Left Periphery of a declarative complementizer); (29c)/(30c) show instances of short Focus movement in embedded wh-questions.\(^{13}\)

---

\(^{11}\) With certain wh-phrases the CLLD Topic can also be found to the right of the wh-phrase:

(i) a. Dhen ksero pjos, afto to vivlio tha to diavasi ja avrio (Alexiadou 1997, 70)
   This seems also true in Bulgarian, although the possibility is attested with ‘heavier’ wh-phrases only.

\(^{12}\) This co-occurrence is not possible in matrix clauses, probably for independent reasons.

\(^{13}\) This last possibility is also attested in Romanian, according to Cornilescu (2000) who cites cases like (i):

(i) Nu știu cum sunt ațiți, dar eu îmi aduc aminte de asta cu plăcere.
Given the data discussed so far, we can generalize that in Greek and in Bulgarian, constituents that can be Topicalized are also eligible for Focalization. In other words, as predicted by the abstract structures in (4), the two constructions should be syntactically differentiated through the presence vs. absence of a resumptive clitic (in the case of object noun phrases). This, however, does not seem to be the case in Romanian. As reported by Dobrovie-Sorin (1990), Corniles cu (2000), Alboiu (2000), in this language, not just Topics, but also focused phrases can be clitic resumed:

(31) **Pe Petru** Maria nu l-ar ajuta, pe Gheorghe, da; Eu [F **pe Popescu**] l-am vazut (nu pe Ionescu); Eu [F romanul ășta] l-am citit (nu pe calalt). (Dobrovie-Sorin 1990, 220)

According to Dobrovie-Sorin, clitic resumption is in fact required when overt movement takes place. However, it seems more correct to say that the distribution of focused phrases in Romanian seems to be semantically motivated. On the one hand, Romanian observes the pan-Balkan requirement that ‘bare’ nouns (i.e. nouns without any determiner) cannot be clitic resumed. Corniles cu (2000) reports that even if focus is marked lexically, through focus particles like numai ‘only’, chiar ‘even’, macar ‘at least’, clitic resumption is not just possible but obligatory if the dislocated object is a proper name or a definite phrase. In the case of ‘bare’ object phrases, no clitic resumption is possible:

(32) a. **Numai pe Ion il iubește Maria.**
   b. **Macar cartea asta au citit-o elevii.**
   c. **Mașină vrea Victor, nu casă.**

According to Corniles cu, in these examples doubling is obligatory because of the inherent semantics of the proper names or of the definite descriptions, which are “good” topics. Whatever the explanation for the distribution of clitic resumed phrases in Romanian focus construction, it must be correlated with semantic contrasts such as definiteness vs. indefiniteness. The presence of the preposition *pe* is a necessary but not a sufficient condition for clitic resumption (as argued by Dobrovie-Sorin 1994), because there are contexts where *pe* fails to trigger resumption. Cf. (33) which contains the focalized indefinite determiner *pe altcineva* ‘someone else’ and (34) which exemplifies the contrast between the two wh-phrases *cine* ‘who’ and *care* ‘which’:

(33) Ion *pe altcineva* așteaptă, nu pe Maria.
(34) a. **Pe care il vezi mîine?**
   b. *Pe cine* il vezi mîine?

The obligatory nature of object reduplication in Romanian which distinguishes even between the two types of wh-structures - *cine* ‘who’ vs. *care* ‘which’ questions - might be related to

---

14 ‘Indefiniteness’ here should be understood in the sense of Assenova (2002, 115), i.e. to refer to nouns unaccompanied by any type of determiner, be it a definite or an indefinite articles, an adjective, or some pronominal modifier. The author argues that in the Balkan languages, clitic resumption is impossible only with indefinite nouns. Clitic resumption therefore may serve as a test for establishing grammatical definiteness.

15 According to Alboiu (2000), certain quantifiers (both universal and distributive) like oricine ‘anyone’, fiecare ‘each’ can be clitic resumed, as opposed to ‘bare’ quantifiers like fiecă ‘every’, and cineva ‘someone’. The author argues that, depending on their inherent semantics, quantifiers behave as CLLD Topics or as Focus. Hence their split behaviour.

16 Greek and Bulgarian do not make this distinction, so clitic resumption of wh-phrases needs some special licensing conditions. In general, clitic resumption of bare wh-phrases is impossible:

(i) (Bg) *Koj go vidja?; (Gr) Pjon (?)to agapai i mama?
the grammaticalization of clitic doubling (*anticipatio* of the object) – a phenomenon found in other Romance languages as well.

2.3. *Linear orders of Topic and Focus in the Balkan languages*

Finally, another property shared by all of the Balkan languages under study is the relative order of Topics and Focus in the left periphery. In a single clause, there can be multiple CLLD Topics but there is always a single Focus per clause (also know as ‘Focus uniqueness requirement†). Moreover, in conformity to the universal organization of the Left Periphery, Topics must precede contrastively Focused phrases: contrastively focused phrases, bare quantifiers, as well as wh-phrases which have also been argued to possess focus features (Horvath 1986). There is also a tendency for these latter constituents to appear adjacent to the Verb. Examples are provided below:

**Rom**

(35) a. [ŢMariel] [Ţflorile acestea] tu nu i le poţi cumpăra. (from Cornilescu 2000, 2)
   b. [Ţ Mariel] [F flori] este potrivit să-i oferi.
   c. [Ţ Pe Victor] [F cine]-l asteapta la aeroport. (from Alboiu 2000)

**Bg**

(36) a. [ŢNa Maria] [Ţ tezi cvetja] såm i gi podaril az.
   b. [Ţ Marija ] [F măzhat i ] ja iznika i tja se pribra.
   c. [Ţ I nego ] [F koj] go pita, ama na – kato e za razvala, i toj e tam.

**Gr**

(37) a. [ŢTa vivlia] [F sti Maria] ta edhosa. (Alexiadou 1997, 74)
   b. Me rotise [Ţ sti Maria] [F pjos] tis edhose ahta ta vivlia.

The overall order of the dislocated phrases in the Greek, Bulgarian and Romanian adheres to the following structural hierarchy:

HTLD > CLLD (CLLD) > FOCUS

3. **Conclusion**

The organization of the Left Periphery in the Balkan languages, including the relative order of Topic and Focus, reflects a stable typological tendency rather than a pure Sprachbund effect. Nevertheless, the development of the common discourse patterns can be seen as a follow-up process on some of the convergence phenomena (object reduplication and the morpho-syntactic expression of definiteness), which, among other phenomena lead to the establishment of the Balkan Language Union (Assenova 2002). According to Minčeva (1969), Topic structures illustrate some of the most specific properties of the syntax of colloquial speech: shaping of intonational-syntactic groups, the possibility for segmentation of the utterance which is different “deviates” from the norms of the standard language, ellipsis, pleonasm, etc. These principles have manifested themselves at quite an early stage in the Balkan context. The same could be hypothesized for Focus structures which not only allowed for the independent syntactic expression of (different kinds of) non-presupposed information, but also create additional stylistic effects. Given the colloquial nature of the bi- and multilingual contacts at the time when the main Balkanisms were integrated into the structure of each language, the universal principles of (colloquial) syntax must have fed the general Balkan tendency towards a greater word order freedom. Topic and Focus are especially relevant for communication purposes, so it is not surprising that such structures have been favoured by speakers in contact situations.
